

MyOffers Phase 2 Implementation Brief

1. Phase 2 Objective

Phase 2 should move MyOffers from a working hyperlocal commerce platform into a stronger growth-and-operations engine.

The next phase should focus on three business outcomes:

- 1. **Expand campaign reach** beyond current in-app inbox delivery.
- 2. **Improve operator intelligence** so teams act faster and with less manual analysis.
- 3. **Deepen AI-assisted execution** so merchants and operators do more with fewer steps.

2. Current Baseline

The following are already live and are **not** the main Phase 2 build target:

- OTP login and role-based dashboards
- SSA / CSA lead creation and invite retry
- shopkeeper onboarding and subscription journeys
- free / trial / paid monetization flow
- offer creation and customer discovery
- customer likes, favorites, claims
- QR/manual redemption with reward payout
- coin wallet, ledger, milestones, admin reward controls
- customer loan intake
- customer AI chatbot
- shopkeeper AI credits and credit-pack purchase
- campaign draft, estimate, payment, queue, and in-app inbox delivery

Baseline summary table

Capability	Current state
Campaign creation	Live
In-app campaign delivery	Live

Capability	Current state
WhatsApp delivery	Partially staged / not fully live
Email delivery	Announced, not live
Push delivery	Announced, not live
AI help chat	Live
AI merchant credit system	Live
Claims / redemption / rewards	Live
Subscription funnel	Live

3. Phase 2 Capability Blocks

A. Omnichannel Campaign Expansion

Goal: turn campaigns from mainly in-app messaging into a broader merchant growth channel.

What to add

- Activate real WhatsApp delivery flow end to end.
- Add push-notification delivery pipeline.
- Add email delivery when applicable.
- Provide channel-wise delivery state, not just campaign state.
- Make scheduled campaigns operationally reliable across channels.

Why it matters

- Merchants get broader reach from the same campaign builder.
- Campaign spend becomes easier to justify.
- Platform can introduce channel-wise pricing and packaging later.

B. Campaign Performance and Operator Visibility

Goal: reduce guesswork for shopkeepers, admins, and operators.

What to add

- richer campaign performance view

- delivery funnel visibility by channel
- reach, opens, clicks, and campaign efficiency summaries
- plan-aware analytics that explain locked vs unlocked insights
- stronger admin visibility into campaign health and usage trends

Why it matters

- Better renewal conversations with merchants.
- Easier identification of high-performing locations, offers, and audience slices.
- Better support and escalation handling for failed or weak campaigns.

C. AI Content and Decision Assist

Goal: move AI from support-only into execution support.

What to add

- shopkeeper campaign-copy assist
- banner / creative generation tied to AI-credit usage
- analytics copilot for admins and operators
- guided AI suggestions inside campaign setup

Why it matters

- Merchants launch faster.
- Content quality improves without agency dependence.
- Admin teams can explain performance faster.

D. Smarter Retention and Risk Signals

Goal: help the platform act before merchants churn or misuse grows.

What to add

- churn-risk indicators for subscriptions
- campaign underperformance flags
- coupon / like / redemption abuse alerts
- operational recommendations for intervention

Why it matters

- Protects MRR.

- Improves trust in rewards and coupon systems.
- Gives admin teams a proactive operating layer.

4. Role-Wise Impact

Role	Phase 2 impact
Super Admin	Better control over campaign performance, risk signals, and channel rollout governance
Subadmin	Better analytics, failure visibility, and intervention tools
Company Sales Agent	Stronger merchant sales story with measurable campaign reach and outcomes
SSA	Better conversion support through campaign-ready merchant onboarding
Shopkeeper	More delivery channels, better campaign outcomes, AI-generated content, clearer ROI
Customer	Better-timed outreach, richer campaign messages, more relevant alerts

5. Flow Changes

5.1 Campaign flow after Phase 2

5.2 Admin operations flow after Phase 2

5.3 AI-assisted merchant flow after Phase 2

6. Acceptance View

Phase 2 should be considered complete when operations and client stakeholders can clearly observe the following:

Commercial acceptance

- A merchant can run the same campaign through more than one effective delivery channel.
- Campaign results are visible in business terms, not only technical status.
- AI helps merchants create launch-ready campaign assets faster.

Operational acceptance

- Admin teams can see which campaigns delivered, failed, underperformed, or need intervention.
- Support teams can identify whether the issue is audience, channel, pricing, or execution.
- Governance teams can spot abuse or risk patterns earlier.

Product acceptance

- Shopkeepers feel campaign value is measurable.
- Customers receive more relevant and better-timed outreach.
- The platform can explain why a merchant should renew, upgrade, or buy more usage.

7. Suggested Phase 2 Scope Boundary

In scope

- WhatsApp / push / email campaign rollout
- stronger campaign reporting
- AI campaign-content assist
- operator insight layer
- risk and retention signals

Out of scope for this Phase 2

- full marketplace redesign
- role-model changes
- reworking core claim / redemption / reward logic

- replacing the subscription foundation

8. Business Readout

Phase 1 established the operating rails: onboarding, subscriptions, offers, claims, redemption, rewards, campaigns, loans, and AI help.

Phase 2 should now turn those rails into measurable scale.

That means:

- more campaign reach
- more visible merchant ROI
- more admin intelligence
- more AI-assisted execution
- more predictable retention and governance
